Idera

Some information about me ...

Before starting in SharePoint, I was part of a team responsible for implementing an insurance and financial services company's first DR site.

I've been working with SharePoint since SharePoint Portal Server 2003 and WSSv2 (started writing web parts)

I've co-authored two books on SharePoint disaster recovery.

Agenda

Agenda

1. Discuss new capabilities and features that alter the disaster recovery (DR) landscape in SharePoint 2010

Agenda

1. Discuss new capabilities and features that alter the disaster recovery (DR) landscape in SharePoint 2010
2. Talk about improvements to existing SharePoint 2007 functionality that is related to DR

Agenda

1. Discuss new capabilities and features that alter the disaster recovery (DR) landscape in SharePoint 2010
2. Talk about improvements to existing SharePoint 2007 functionality that is related to DR
3. Cover a few "special attention" DR topics

Have you seen "Men
In Black 2?"

(excerpt from "Men In Black 2")

(excerpt from "Men In Black 2")

"Old and busted"
(SharePoint 2007)

(excerpt from "Men In Black 2")

(SharePoint 2010)
"The New Hotness"

"The New Hotness"

- PowerShell support
- Configuration-only backup/restore
- SQL Server snapshot integration
- Unattached database recovery
- SQL Server database mirroring

Disaster Recovery Implications

| | Planning | Operational |
|-------------------------------------|---|--|
| Powershell | <ul style="list-style-type: none"> • Will alter documented procedures that involve scripting • Provides new avenues for the collection of configuration data (for example, using the Export-Clixml cmdlet) | <ul style="list-style-type: none"> • May lead to changes in script execution and scheduling <ul style="list-style-type: none"> * PowerShell remoting! • Efficiency and concurrency improvements may shorten RTO windows |
| Configuration Backup/Restore | <ul style="list-style-type: none"> • Can be helpful for point-in-time configuration captures • Useful when establishing/maintaining standby farms • Judicious use may remove the need to document some farm config settings | <ul style="list-style-type: none"> • Generally minimal • If recovery plan employs a full farm rebuild, configuration-only restores can help reduce RTO windows <ul style="list-style-type: none"> * Easy solution store recovery |
| SQL Server Snapshots | <ul style="list-style-type: none"> • Snapshots place additional load on SQL Server, so size and plan SQL Server environments accordingly • Budget for a version of SQL Server that supports snapshots | <ul style="list-style-type: none"> • Snapshots can increase SharePoint availability by avoiding locking • Can break out of traditional backup window constraints (i.e., avoid backup "overruns") |
| Unattached DB Recovery | <ul style="list-style-type: none"> • Reduces or removes the need for (dedicated) recovery farms • May affect SQL Server capacity planning and sizing | <ul style="list-style-type: none"> • Reduces operating overhead since recovery farms are not needed • Can reduce RTO window for granular recovery activities <ul style="list-style-type: none"> * Avoid recovery farm patching! |
| SQL DB Mirroring | <ul style="list-style-type: none"> • Mirroring for DR carries significant data center design and location considerations • Profound impact to DR strategies and plans • SQL Server sizing and capacity planning implications <ul style="list-style-type: none"> * extra threads! | <ul style="list-style-type: none"> • Effectively reduces RPO windows to zero and prevents data loss (in HA mode) • Can drastically reduce RTO windows versus conventional backups |

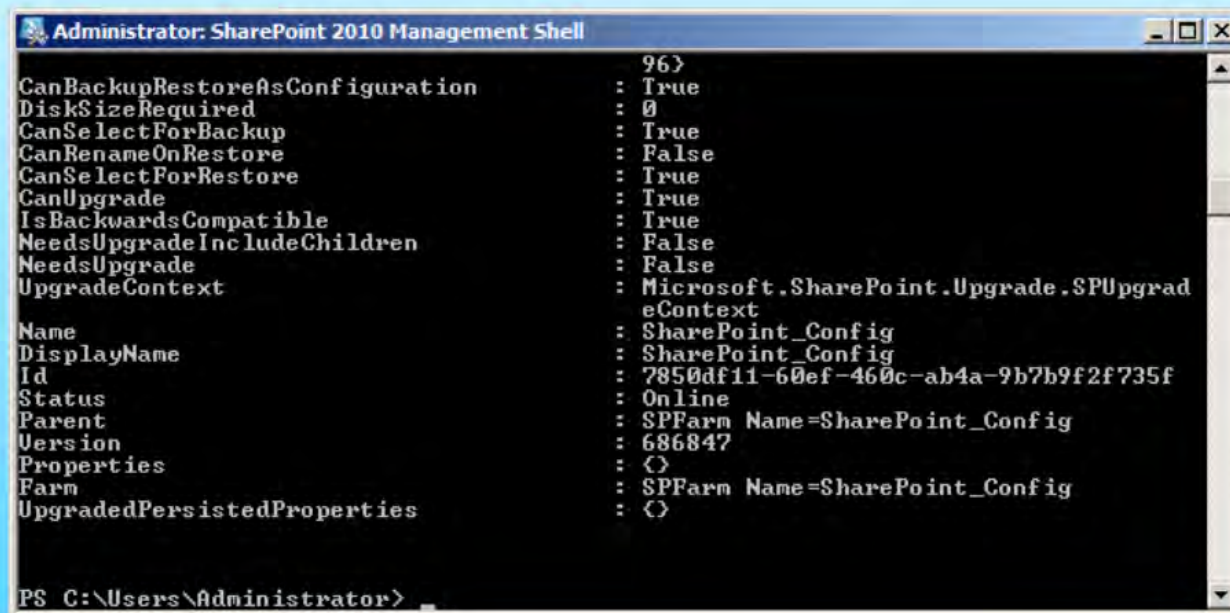

PowerShell

wait!

Wait!

This is still a DR presentation ... right?

Absolutely

```
Administrator: SharePoint 2010 Management Shell
96>

UpgradedPersistedProperties      : {}

PS C:\Users\Administrator>
```

... but PowerShell pervades the SharePoint platform. As an admin, you need it to completely leverage SharePoint's capabilities.

So what is PowerShell?

super tiny subtitle:

"for those who have been living under a rock"

So ... what is PowerShell?

- Command line of the future
- >500 cmdlets supply SharePoint specific operations
- Object oriented, more efficient, and more capable

So ... what is PowerShell?

- Command line of the future
- >500 cmdlets supply SharePoint specific operations
- Object oriented, more efficient, and more capable

Why you should care

- All signs say that STSADM.exe is on its way out
- PowerShell empowers you to carry out admin tasks more quickly and effectively

An example

Assigning a custom 404 page for all Web applications that don't currently have one

Before PowerShell (aka, "the dark days")

Before PowerShell (aka, "the dark days")

1. Place HTML page in the file system of each WFE

Before PowerShell (aka, "the dark days")

1. Place HTML page in the file system of each WFE
2. Fire-up Visual Studio on a workstation with SharePoint

Before PowerShell (aka, "the dark days")

1. Place HTML page in the file system of each WFE
2. Fire-up Visual Studio on a workstation with SharePoint
3. Create a custom console application

Before PowerShell (aka, "the dark days")

1. Place HTML page in the file system of each WFE
2. Fire-up Visual Studio on a workstation with SharePoint
3. Create a custom console application
- 3a. Set appropriate SharePoint assembly references

Before PowerShell (aka, "the dark days")

1. Place HTML page in the file system of each WFE
2. Fire-up Visual Studio on a workstation with SharePoint
3. Create a custom console application
 - 3a. Set appropriate SharePoint assembly references
 - 3b. Enter three lines of C# code

Before PowerShell (aka, "the dark days")

1. Place HTML page in the file system of each WFE
 2. Fire-up Visual Studio on a workstation with SharePoint
 3. Create a custom console application
 - 3a. Set appropriate SharePoint assembly references
 - 3b. Enter three lines of C# code

Yes -- just 3 lousy lines of code!

Before PowerShell (aka, "the dark days")

1. Place HTML page in the file system of each WFE
2. Fire-up Visual Studio on a workstation with SharePoint
3. Create a custom console application
 - 3a. Set appropriate SharePoint assembly references
 - 3b. Enter three lines of C# code

Yes -- just 3 lousy lines of code!

4. Compile the console application

Before PowerShell (aka, "the dark days")

1. Place HTML page in the file system of each WFE
 2. Fire-up Visual Studio on a workstation with SharePoint
 3. Create a custom console application
 - 3a. Set appropriate SharePoint assembly references
 - 3b. Enter three lines of C# code

Yes -- just 3 lousy lines of code!

4. Compile the console application
5. Run the application on a SharePoint farm member

Before PowerShell (aka, "the dark days")

1. Place HTML page in the file system of each WFE
2. Fire-up Visual Studio on a workstation with SharePoint
3. Create a custom console application
 - 3a. Set appropriate SharePoint assembly references
 - 3b. Enter three lines of C# code

Yes -- just 3 lousy lines of code!

4. Compile the console application
5. Run the application on a SharePoint farm member

Detail: <http://support.microsoft.com/kb/941329>

Average SharePoint administrator
after performing these steps

Same task using PowerShell

Same task using PowerShell

1. Place HTML page in the file system of each WFE

Same task using PowerShell

1. Place HTML page in the file system of each WFE
2. Execute the following line of PowerShell

```
Get-SPWebApplication | Where-Object  
{$_ .FileNotFoundPage -eq $NULL} | ForEach-Object  
{$_ .FileNotFoundPage = "Custom404.htm"; $_.Update() }
```

Same task using PowerShell

1. Place HTML page in the file system of each WFE
2. Execute the following line of PowerShell

```
Get-SPWebApplication | Where-Object  
{$_ .FileNotFoundPage -eq $NULL} | ForEach-Object  
{$_ .FileNotFoundPage = "Custom404.htm"; $_.Update() }
```

That's it.

Same task using PowerShell

1. Place HTML page in the file system of each WFE
2. Execute the following line of PowerShell

```
Get-SPWebApplication | Where-Object  
{$_ .FileNotFoundPage -eq $NULL} | ForEach-Object  
{$_ .FileNotFoundPage = "Custom404.htm"; $_.Update() }
```

That's it.

No, really -- that's literally all it takes!

Same task using PowerShell

1. Place HTML page in the file system of each WFE
2. Execute the following line of PowerShell

```
Get-SPWebApplication | Where-Object  
{$_ .FileNotFoundPage -eq $NULL} | ForEach-Object  
{$_ .FileNotFoundPage = "Custom404.htm"; $_.Update() }
```

That's it.

No, really -- that's literally all it takes!

This wasn't a DR example, but ...

... this should give you an idea of the DR landscape with PowerShell in SharePoint 2010

Some SP2010 Backup/Restore-related cmdlets

| Operation | STSADM.exe (2007) | PowerShell (2010) |
|------------------------------------|---------------------------------------|---|
| Farm backup and restore | STSADM -o backup STSADM -o restore | Backup-SPFarm Restore-SPFarm |
| Site collection backup and restore | STSADM -o backup STSADM -o restore | Backup-SPSite Restore-SPSite |
| Granular export and import | STSADM -o export STSADM -o import | Export-SPWeb Import-SPWeb |
| Configuration backup and restore | N/A | Backup-SPFarm Restore-SPFarm Backup-SPConfigurationDatabase |

Disaster Recovery Implications

The pain we all felt in SharePoint 2007

The pain we all felt in SharePoint 2007

- You need to set up additional farms
- How do you copy configuration data between farms?

The pain we all felt in SharePoint 2007

- You need to set up additional farms
- How do you copy configuration data between farms?

Introducing ...

Configuration-only backup and restore

Configuration-only backup and restore

- Extension of the backup/restore API

Configuration-only backup and restore

- Extension of the backup/restore API
- Components report their portable configuration data

Configuration-only backup and restore

- Extension of the backup/restore API
- Components report their portable configuration data
- Captured in a standard native backup set

Configuration-only backup and restore

- Extension of the backup/restore API
- Components report their portable configuration data
- Captured in a standard native backup set
- Backup set can then be restored either in-place (restore a farm's previous settings) or out-of-place (to copy one farm's settings to another)

Alright, send in the clones!

not so fast ...

Selecting full-farm for configuration-only backup inside of SharePoint Central Admin

| | | |
|--|---|--|
| <input type="checkbox"/> Farm | Farm | Content and configuration data for the entire server farm. |
| <input type="checkbox"/> SharePoint_Config | Configuration Database | Configuration data for the entire server farm. |

Hmmmm ... does that look a little "light?"

The reality

Configuration-only backup/restore captures a limited subset of configuration data

Configuration-only backup/restore captures a limited subset of configuration data

- Antivirus settings
- Information rights management (IRM) settings
- Outbound e-mail settings
- Customizations and solution packages
- Diagnostic logging settings

Configuration-only backup/restore captures a limited subset of configuration data

- Antivirus settings
- Information rights management (IRM) settings
- Outbound e-mail settings
- Customizations and solution packages
- Diagnostic logging settings

Web application settings aren't captured. Ouch.

Configuration-only backup/restore captures a limited subset of configuration data

- Antivirus settings
- Information rights management (IRM) settings
- Outbound e-mail settings
- Customizations and solution packages
- Diagnostic logging settings

Web application settings aren't captured. Ouch.

Service Application configuration data isn't captured, either. Double ouch.

Your farm clones are going to look less like this ...

... and more like this

Disaster Recovery Implications

| | Planning | Operational |
|-------------------------------------|---|--|

Snapshots

|||

What is a snapshot?

What is a snapshot?

- For all practical purposes, it's a copy of a database with data that remains consistent to the point in time at which the snapshot was created

What is a snapshot?

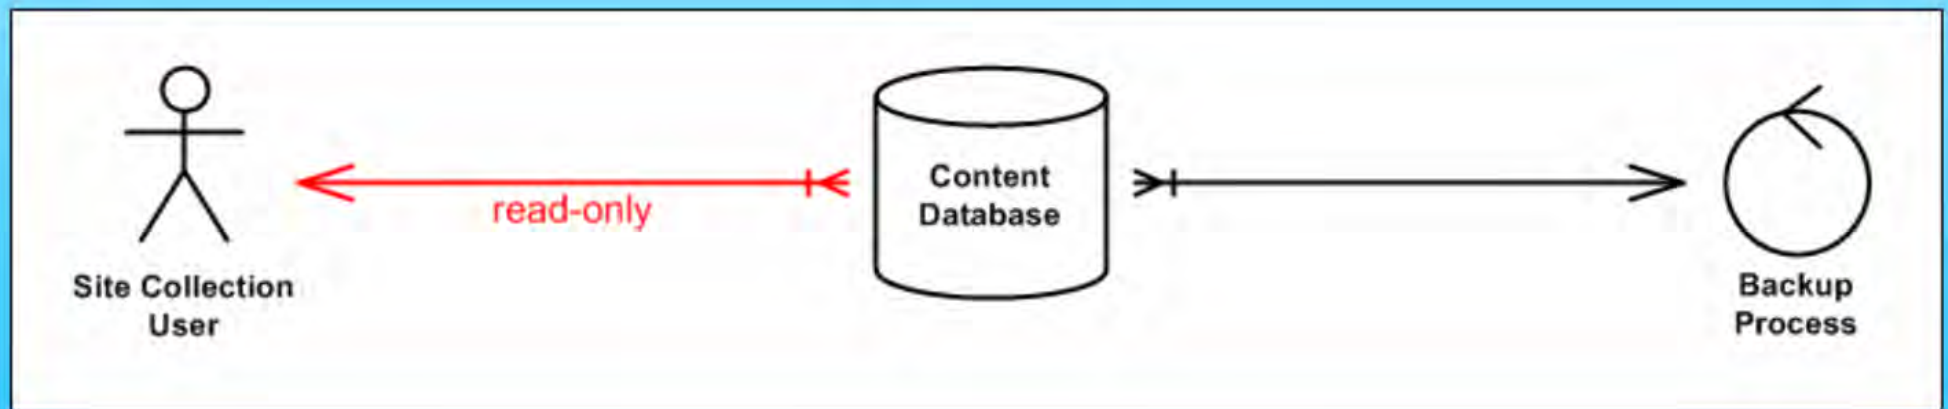

- For all practical purposes, it's a copy of a database with data that remains consistent to the point in time at which the snapshot was created
- Requires SQL Server Enterprise or Developer edition

How do snapshots integrate with SharePoint?

- Object model support (via SPDatabase)
- Snapshot clean-up through Microsoft SharePoint Foundation Snapshot Management timer job
- Admin tools extended to use snapshots where possible
 - * *Backup-SPSite and Export-SPWeb cmdlets*

Site collection backups without the use of snapshots

Site Collection
User

Site collection backups without the use of snapshots

Site collection is locked to prevent updates

Site collection backups using database snapshots

Site Collection
User

Site collection backups using database snapshots

Site collection remains unlocked; no writes blocked

3. Attach content DB to Web application in recovery farm
4. Export target content using STSADM -o export
5. Copy resultant .cmp export file set to production farm
6. Execute STSADM -o import to bring in content

Feels a little like ...

Start somewhere around here

Get your files back here

Start somewhere around here

Get your files back here

So ... why is the process so convoluted?

The simple answer

The simple answer

Production
DB GUID

Restored
DB GUID

Identifiers are the same in each database, and this leads to GUID and path collision(s) if you attempt to attach a restored DB to the production farm

The simple answer

Production
DB GUID

Restored
DB GUID

Identifiers are the same in each database, and this leads to GUID and path collision(s) if you attempt to attach a restored DB to the production farm

Result: restored databases must be attached to a separate farm for recovery operations.

So, you've got a
production farm . . .

So, you've got a
production farm ...

... and you need
a recovery farm

So, you've got a
production farm ...

... and you need
a recovery farm

Of course, many companies have test environments,
and data should be recovered to a different farm.

So, you've got a
production farm ...

... and you need
a recovery farm

Of course, many companies have test environments,
and data should be recovered to a different farm.

Maybe a separate
staging environment?

So, you've got a
production farm ...

... and you need
a recovery farm

Of course, many companies have test environments,
and data should be recovered to a different farm.

Maybe a separate
staging environment?

Some also use distinct authoring environments

*Obviously, the problems
compound as environments
grow, new ones are created,
and recovery needs change*

Obviously, the problems compound as environments grow, new ones are created, and recovery needs change

So, the big brains on the SharePoint product team toiled long and hard to give us a better mechanism with SharePoint 2010.

So, the big brains on the SharePoint product team toiled long and hard to give us a better mechanism with SharePoint 2010.

Unattached content database recovery

What is unattached content
database recovery?

What is unattached content database recovery?

- Allows SharePoint to operate against a content database without actually joining it to the farm

What is unattached content database recovery?

- Allows SharePoint to operate against a content database without actually joining it to the farm
- Sidesteps problems and restrictions associated with duplicate GUIDs

What is unattached content database recovery?

- Allows SharePoint to operate against a content database without actually joining it to the farm
- Sidesteps problems and restrictions associated with duplicate GUIDs
- Net effect: no more recovery farms!

So, what's mirroring?

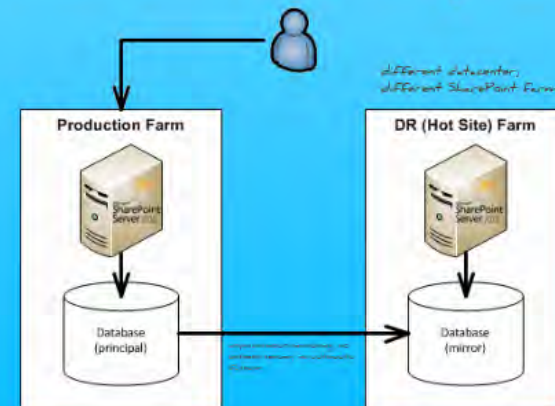

Committing database transactions in two instances of a database (in two different SQL Server instances) at once

Implementation details depend on how you're trying to use mirroring ...

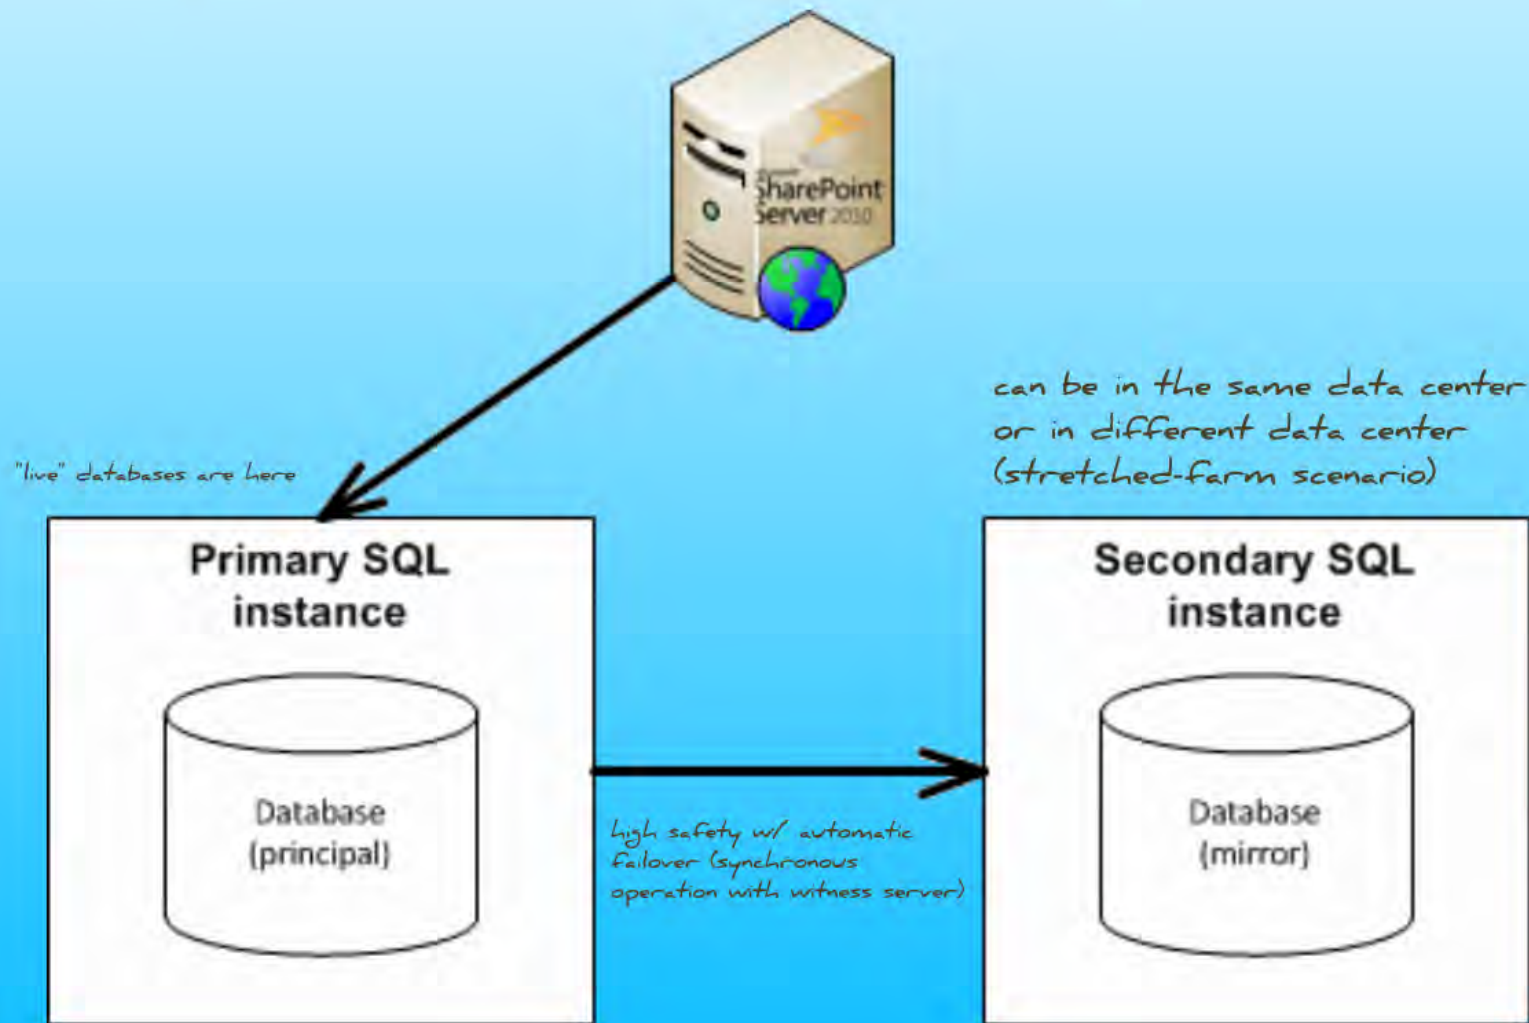

High Availability (HA)

Disaster Recovery (DR)

High Availability (HA)

"live" databases are here

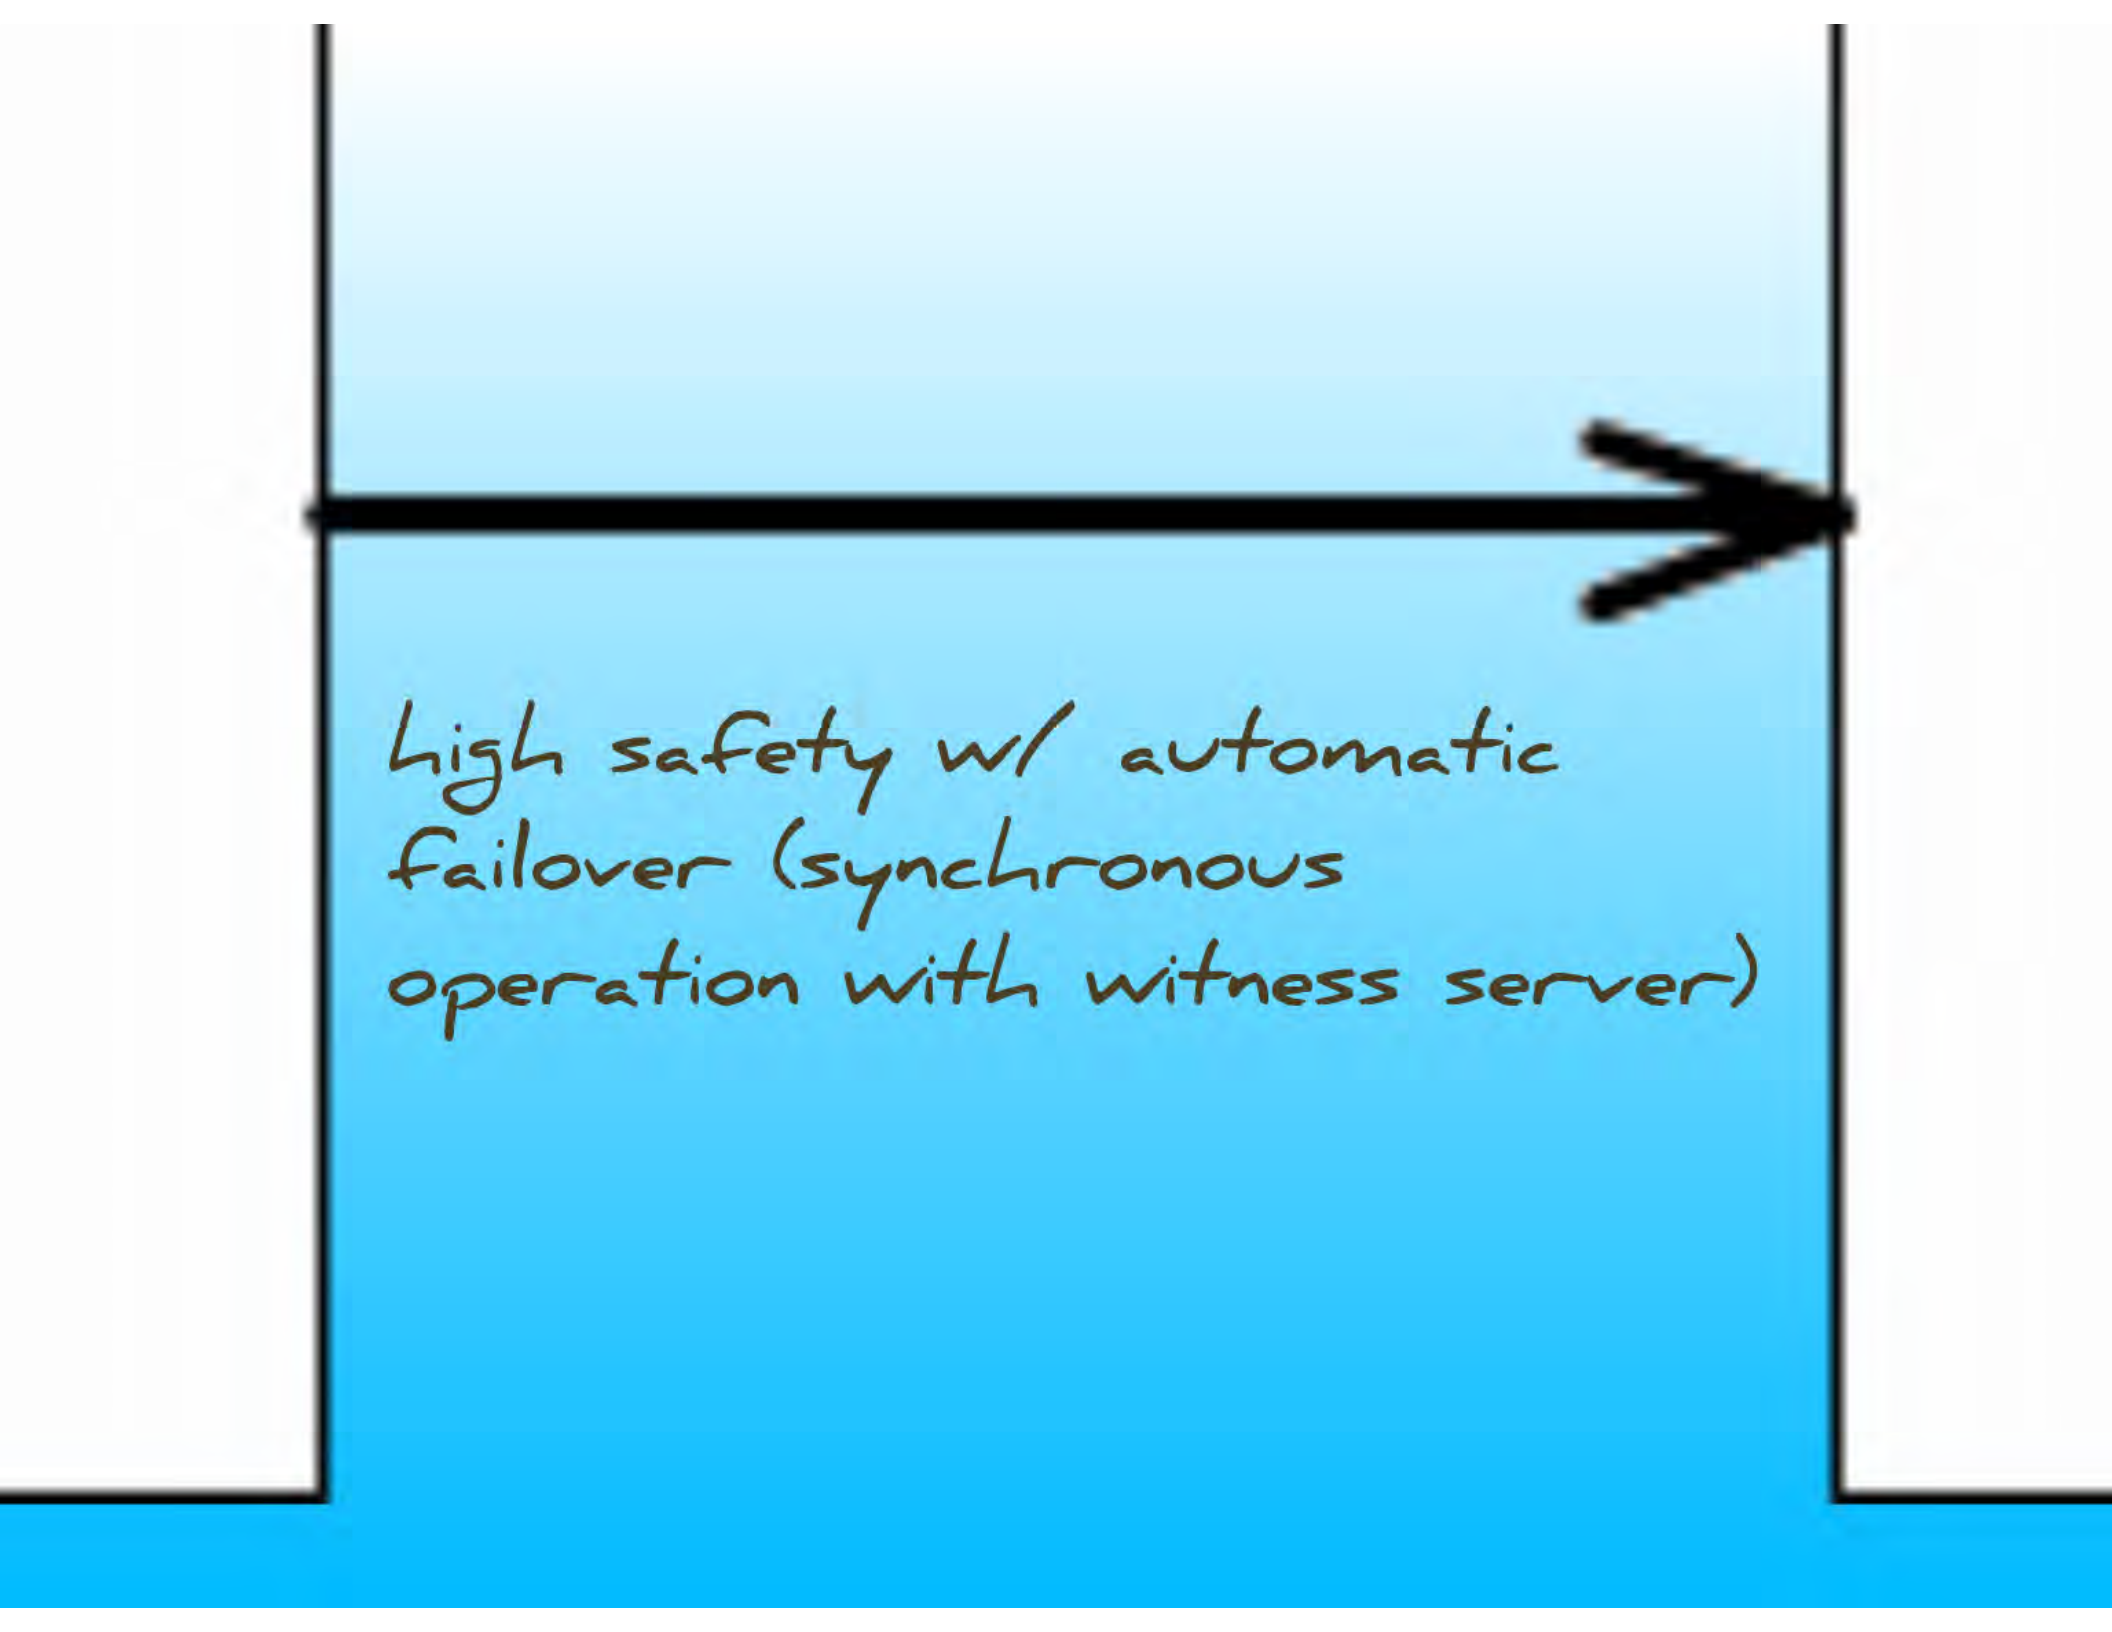

**Primary SQL
instance**

Database
(principal)

can be in the same data center
or in different data center
(stretched-farm scenario)

**Secondary SQL
instance**

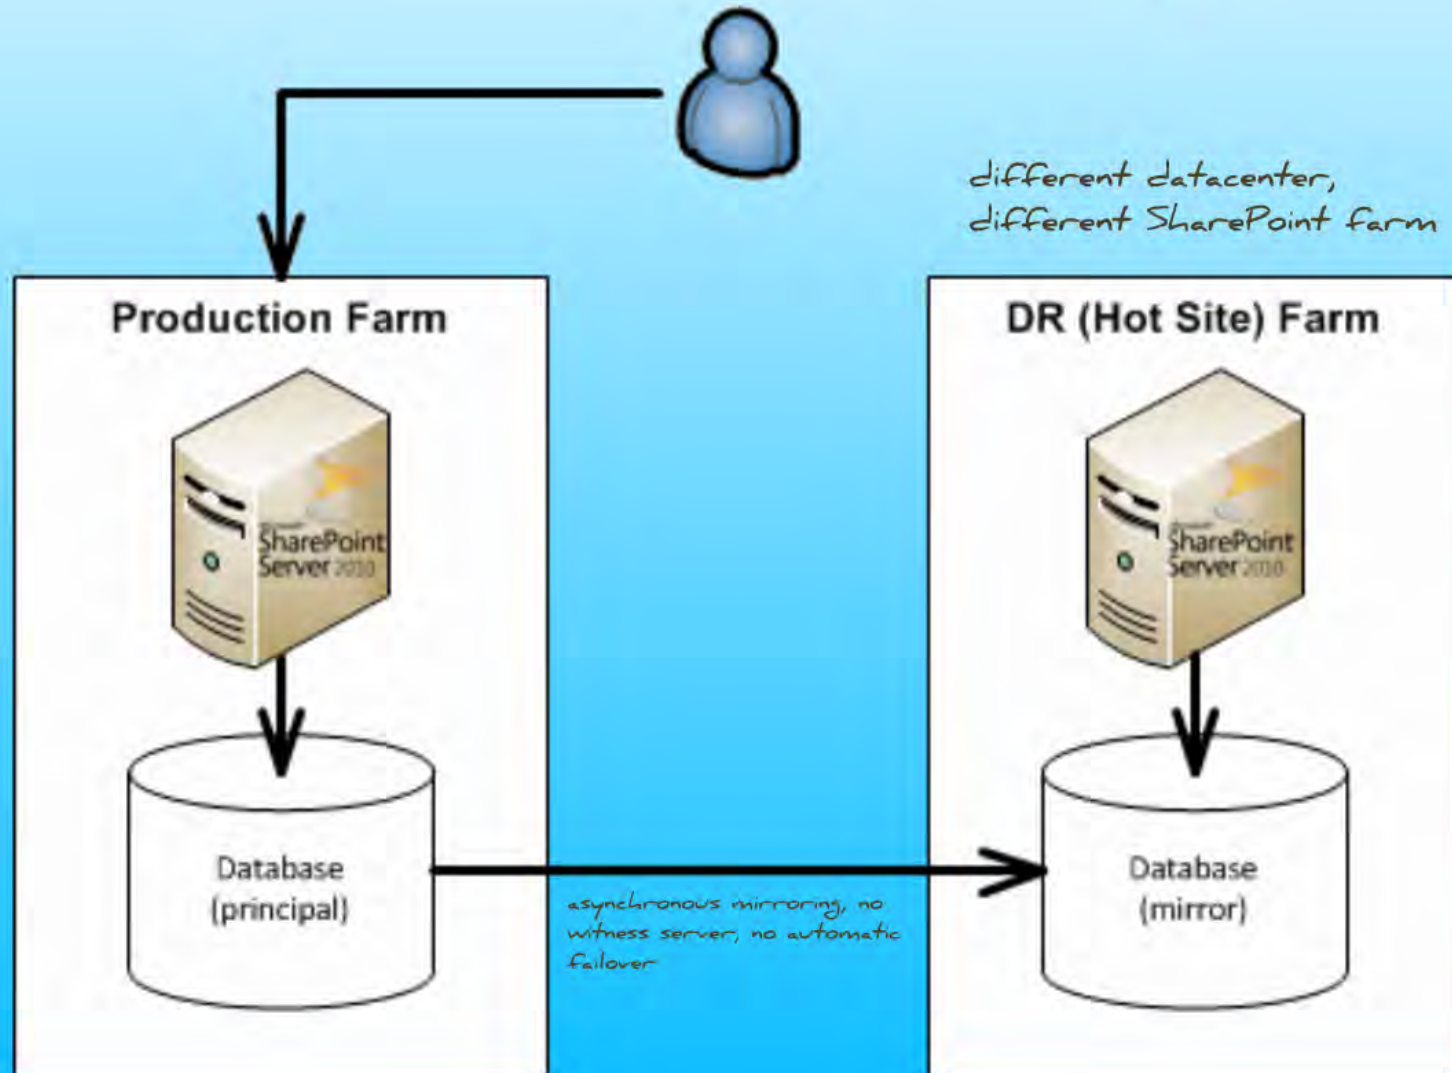

High safety w/ automatic
failover (synchronous
operation with witness server)

High Availability (HA)

Disaster Recovery (DR)

different datacenter,
different SharePoint farm

DR (Hot Site) Farm

asynchronous mirroring, no
witness server, no automatic
failover

Disaster Recovery (DR)

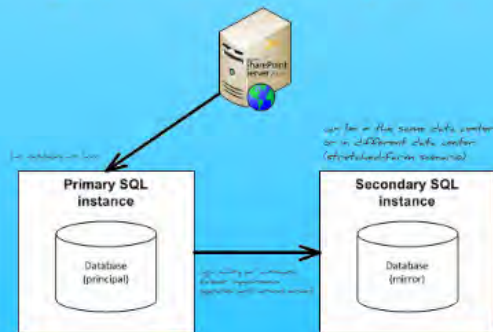

So, what's mirroring?

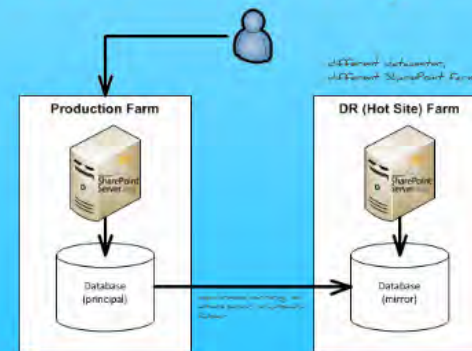

Committing database transactions in two instances of a database (in two different SQL Server instances) at once

Implementation details depend on how you're trying to use mirroring ...

High Availability (HA)

Disaster Recovery (DR)

The hoopla in 2010 is centered on mirroring for HA

Let's say that an "incident" occurs
in your production SQL environment ...

Let's say that an "incident" occurs
in your production SQL environment ...

Hard to see,
but that's your
primary SQL
Server

SharePoint 2010
is mirroring-aware
& utilizes "Failover
Partner" keyword

No longer available

**Primary SQL
instance**

**Secondary SQL
instance**

No more registry
hacks, alias
requirements, or splits

No longer available

requirements, or splits

SharePoint 2010
is mirroring-aware
& utilizes "Failover
Partner" keyword

No longer available

No more registry
hacks, alias
requirements, or splits

This works for most databases*, including the
configuration database

If you're going to try mirroring for high availability, there are some requirements you need to be aware of ...

If you're going to try mirroring for high availability, there are some requirements you need to be aware of ...

- SQL Servers must use same version and edition

If you're going to try mirroring for high availability, there are some requirements you need to be aware of ...

- SQL Servers must use same version and edition
- 1Gbps bandwidth between SQL Server instances

If you're going to try mirroring for high availability, there are some requirements you need to be aware of ...

- SQL Servers must use same version and edition
- 1Gbps bandwidth between SQL Server instances
- <1ms latency between SQL Server instances

If you're going to try mirroring for high availability, there are some requirements you need to be aware of ...

- SQL Servers must use same version and edition
- 1Gbps bandwidth between SQL Server instances
- <1ms latency between SQL Server instances
- High-safety mode (synchronous mirroring)

If you're going to try mirroring for high availability, there are some requirements you need to be aware of ...

- SQL Servers must use same version and edition
- 1Gbps bandwidth between SQL Server instances
- <1ms latency between SQL Server instances
- High-safety mode (synchronous mirroring)
- Witness server required for automatic failover

If you're going to try mirroring for high availability, there are some requirements you need to be aware of ...

- SQL Servers must use same version and edition
- 1Gbps bandwidth between SQL Server instances
- <1ms latency between SQL Server instances
- High-safety mode (synchronous mirroring)
- Witness server required for automatic failover
- Mirrored databases must use full-recovery model

If you're going to try mirroring for high availability, there are some requirements you need to be aware of ...

- SQL Servers must use same version and edition
- 1Gbps bandwidth between SQL Server instances
- <1ms latency between SQL Server instances
- High-safety mode (synchronous mirroring)
- Witness server required for automatic failover
- Mirrored databases must use full-recovery model
- Planets must align (even Pluto*) during a leap year

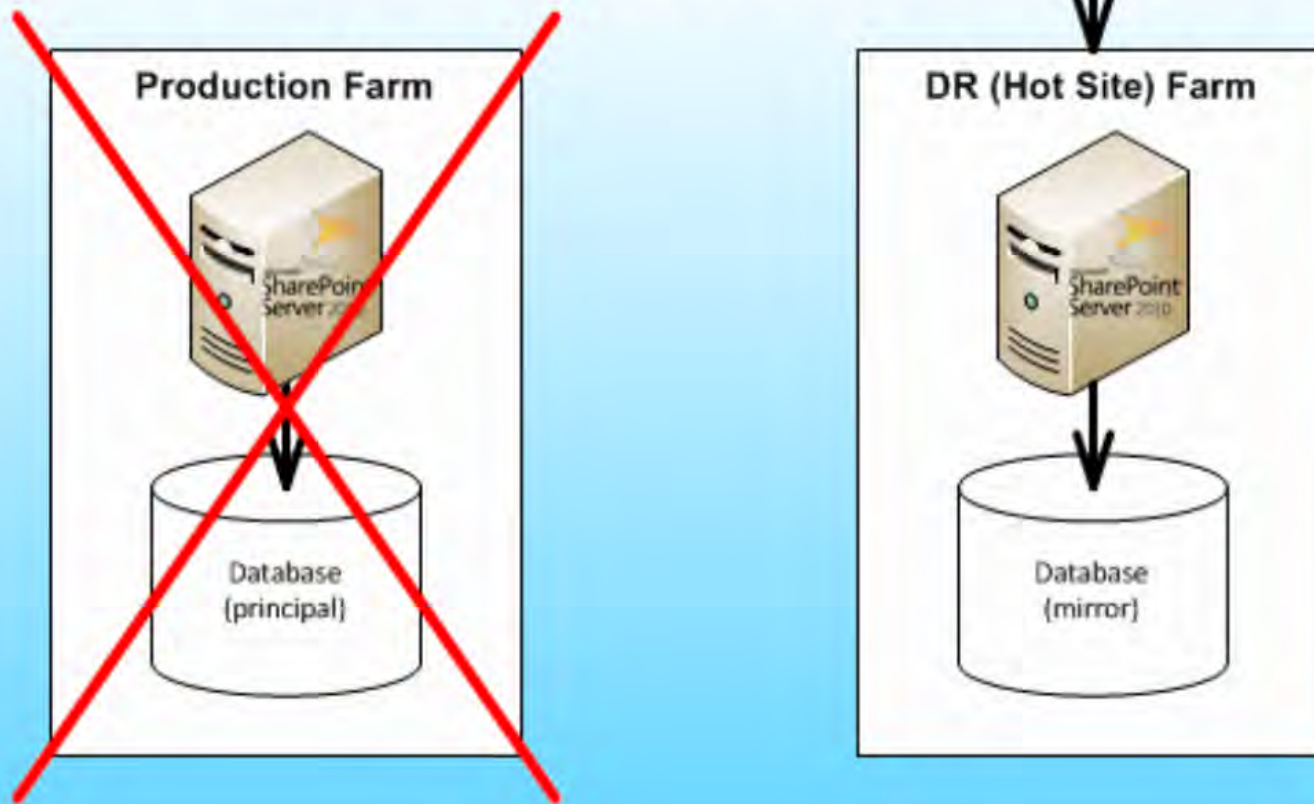

n Pluto*) during a leap year

*technically only a "dwarf planet" these days. What has the world come to?

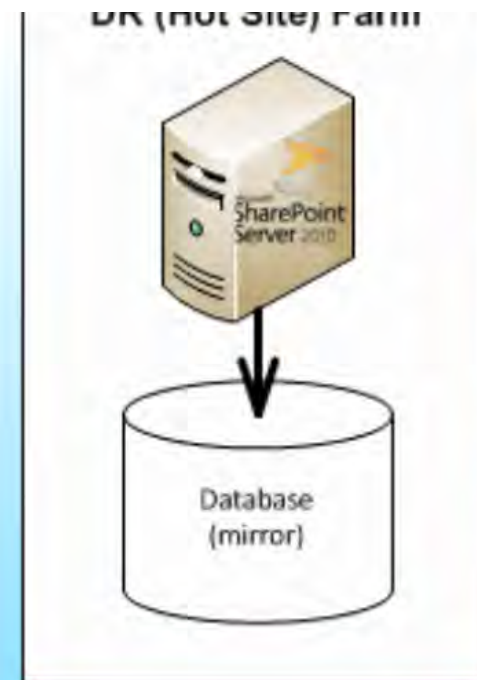

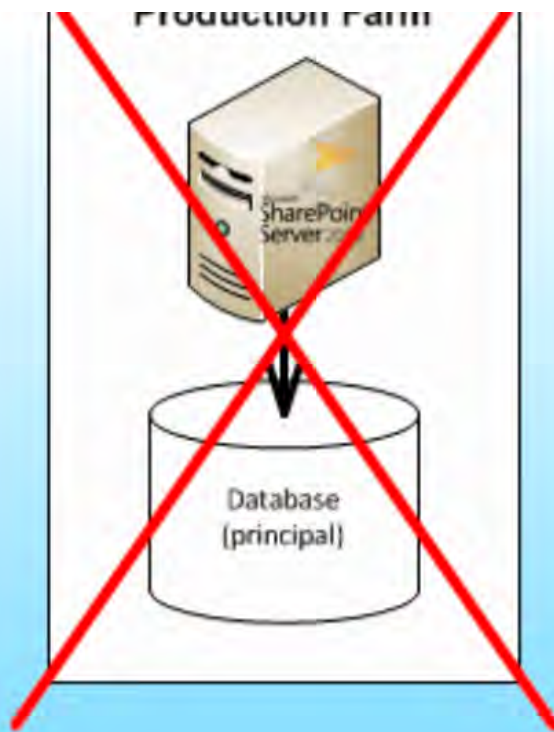

Things are a little different if you're doing mirroring for DR purposes

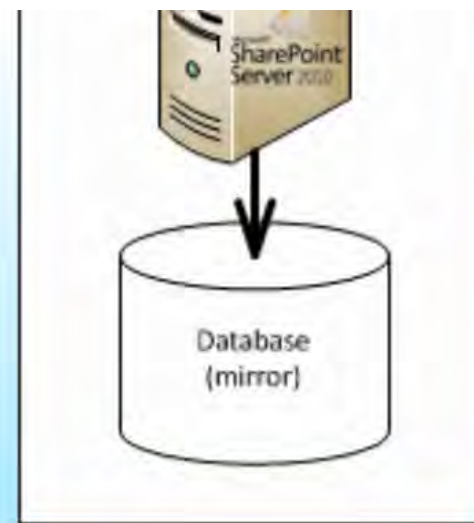

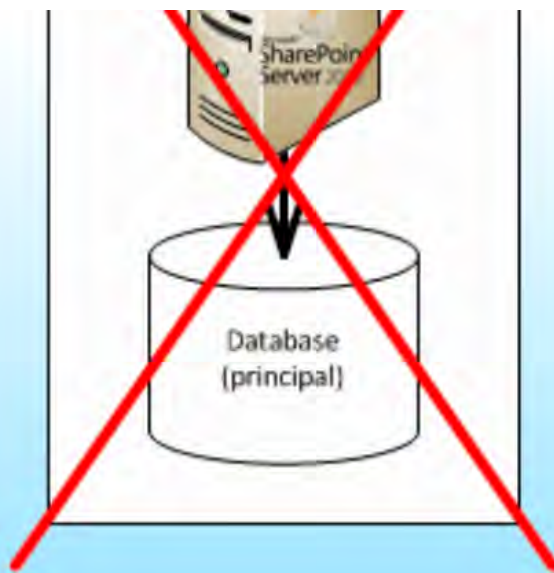

Things are a little different if you're doing mirroring for DR purposes

- Usually asynchronous without witness

Things are a little different if you're doing mirroring for DR purposes

- Usually asynchronous without witness
- Less stringent latency guidelines

Things are a little different if you're doing mirroring for DR purposes

- Usually asynchronous without witness
- Less stringent latency guidelines
- No automatic failover

Things are a little different if you're doing mirroring for DR purposes

- Usually asynchronous without witness
- Less stringent latency guidelines
- No automatic failover
- Potential data loss when mirror server is forced into principal role

Things are a little different if you're doing mirroring for DR purposes

- Usually asynchronous without witness
- Less stringent latency guidelines
- No automatic failover
- Potential data loss when mirror server is forced into principal role

In DR scenarios, consider transaction log shipping over mirroring

databases

Search indexing
and related
operations

Motivation backup

SharePoint 2010 Search Architecture

Important changes

1. Search is broken into two different roles
 - Query: serves results, holds index segments
 - Crawl: indexes content, stateless in its operation
2. Indexing is no longer a single point of failure
 - Both roles can be scaled-up and scaled-out
 - Fault-tolerance and load balancing achievable
3. Search backup is now a two-stage process
 - Crawling continues during 1st stage, paused for 2nd
 - 90% faster than search backup in 2007

Service
application
framework

The good

- Use only the service applications you need; turn off the ones you don't
- Ability to scale-up and scale-out in most cases
- Multi-tenancy and cross-farm consumption (security and scalability options)

The Not-So-Good

- Doesn't participate in configuration-only backup/restore
- Tough to backup/restore -- even with native tools

-
- When using native backup and restore

Document
your farm
configuration!

Documentation alternative:

The screenshot shows a Microsoft Word document titled 'Farm Report.docx' in Compatibility Mode. The document content is titled 'SharePoint Farm Documentation, 7/27/2011 9:40:53 PM'. The main content area displays a table with the following columns: Web Application, Path, Authentication, Application Pool, and three status columns (SSL, Claims Auth, CEP). The table lists various web applications and their configurations.

| Web Application | Path | Authentication | Application Pool | SSL | Claims Auth | CEP |
|--------------------------------------|------|----------------|--------------------------------------|-----|-------------|-----|
| Internal Home Web (80) | / | NTLM | ContentWebsAppPool | ✗ | ✗ | ✗ |
| Internal Home Web (80) | / | NTLM | ContentWebsAppPool | ✗ | ✗ | ✗ |
| My Site Host Web (80) | / | NTLM | ContentWebsAppPool | ✗ | ✗ | ✗ |
| My Site Host Web (80) | / | NTLM | ContentWebsAppPool | ✗ | ✗ | ✗ |
| Sculpted System Webs (80) | / | NTLM | ContentWebsAppPool | ✗ | ✗ | ✗ |

4.2 SITE COLLECTIONS

<http://www.spdockit.com>

Remote

BLOB

storage (RBS)

- Offloading storage of binary large objects (BLOBs) from SQL Server to another storage system
- Reduces content database size (often dramatically)
- RBS provider may support use of cheaper storage, deduplication, archiving, etc.

-
- When using native backup and restore, BLOBs are typically pulled through without issue
 - With SQL Server backups or a 3rd party backup product, understand the implications during backup/restore!
 - *only pointers to BLOBs reside in the content databases - not the BLOBs themselves!*
-

Business
connectivity
services (BCS)

- Evolution of the MOSS Business Data Catalog (BDC) that now supports both reading from and writing to external data sources
- Surfaces data from line-of-business (LOB) systems as external lists that appear to belong to SharePoint

- Though data is surfaced through SharePoint, it doesn't actually exist in SharePoint
- BCS-connected LOB systems must be identified and protected separately of SharePoint

Special attention and consideration

| | The good | The not-so-good |
|--------------------------------------|---|---|
| Service application framework | <ul style="list-style-type: none">• Use only the service applications you need; turn off the ones you don't• Ability to scale-up and scale-out in most cases• Multi-tenancy and cross-farm consumption (security and scalability options) | <ul style="list-style-type: none">• Doesn't participate in configuration-only backup/restore• Tough to backup/restore -- even with native tools |
| Remote BLOB storage (RBS) | <ul style="list-style-type: none">• Offloading storage of binary large objects (BLOBs) from SQL Server to another storage system• Reduces content database size (often dramatically)• RBS provider may support use of cheaper storage, deduplication, archiving, etc. | <ul style="list-style-type: none">• When using native backup and restore, BLOBs are typically pulled through without issue• With SQL Server backups or a 3rd party backup product, understand the implications during backup/restore!<ul style="list-style-type: none">• <i>only pointers to BLOBs reside in the content databases - not the BLOBs themselves!</i> |
